Minutes Of Meeting
(20191101)

In today's meeting I was supposed to demonstrate KeePassXCIPFS, but since I was not ready with the written script asked for in the last meeting the demonstration was postponed to next week. Although I was prepared for the verbal script. Dr.mateti was not much happy with my work as my github was not updated. Next I had asked him whether I can change the synchronization tool as the tool used earlier known as brig was not fully functional and then he asked me to post it on the brig forum or brig github page for the developer to respond. He then provided me with a scenario of 3 users and a synchronization problem. He asked me to read CAP theorem for a solution to it. There were certain doubts regarding the implementation and therefore he even asked me to document software architecture for KeePassXCIPFS. Next he asked me to complete 3 tasks and be ready with the demonstration next week. The 3 tasks included creating a script for demonstration, software architecture as well as github update.
